Abstract

Considering every language, the linguistics research notices distinction between open forms (nouns, verbs...) and closed forms (preposition, conjunctions, adverbs...). The first group constantly develops building our lexical richness. The second group displays very limited number that during our life does not increase. The modern linguistics experiments prove that during the first months following the child's birth, our cognition and behavior are first of all reduced to the closed forms. Later they are lying as a background for the open forms. The metaphysical analysis of the closed forms reveals their fundamental status in different conceptualizations leading to the different interpretations of the world.

Brief Bio:

PhD in Philosophy.

Fields of research: Metaphysics and History of Philosophy ; Biblical and Ancient Mystical Tradition, Linguistics, Ancient Egyptian Language and Religion.
